## Homework: Math Background

## January 22, 2021

1. Let T be the rigid transformation  $T(\mathbf{x}) = W \cdot \mathbf{x} + \mathbf{b}$ , where  $W = (w_{ij})$  is the matrix of size  $2 \times 2$ 

$$W = \begin{pmatrix} 1 & 2 \\ 0 & -1 \end{pmatrix} \tag{1}$$

and  $\mathbf{b} = (-2, -2)^t$ . Calculate the composition  $T \circ T((2, 0)^t)$ .

- 2. Let  $f(x_1, x_2) = x_1^4 + x_2^2$ . What is the gradient of f at the point (-1,0)? Note: recall that if  $g(x) = x^m$ ,  $g'(x) = mx^{m-1}$
- 3. Let U and V be tuples (of size n) of uniformly distributed random numbers in (0,1). Say, U is generated using the random uniform method in the **random** module and V using **numpy**. Define a python function that returns a tuple performing element-wise the function  $f(u,v) = \sqrt{-2 \log u} \cos(2\pi v)$ . What is the empirical mean and standard deviation of the tuple defined by f for tuples of size n = 5000.
- 4. Make a histogram of the tuple defined by the function f from the previous problem. You can use the **numpy** method np.histogram.
